

Uses of getline () function in c++

By Prince Agarwal
[“ Hello World ”]

How we store these all in the string variables

**How we extract the words from
the paragraph
which is stored in string variable**

It means,

Let ->

S = "hii I am prince"

Extract Words

hii

I

am

prince

**How we extract the words from
the paragraph
which is stored in string variable**

For this, We use “stringstream” class

- 1. Make the variable name of stringstream say str (Put string)**
- 2. str (s);**
- 3. Make another string type variable which stores the words say words;**
- 4. Iterate the str i.e.**
- 5. while(str >> words)**
{
Cout << words ;
}
